

Constant Air Volume Control
BM-CAV-01

Constant Air Volume Control

BM-CAV-02 regulators are used for automatic constant air flow control in ventilation installations. They maintain constant air volumes regardless of the changes of static pressure in the ventilation duct. They operate automatically, without any external power supply. Regulation range is from 2 to 12 m/s, operating pressure from 50 to 1000 Pa. Complies with EN 1751 casing air leakage has class C, close blade air leakage has class 0. The changes of set values can be made independently by the user, so the regulator is delivered with default factory settings. It is possible to order factory-made value settings, which should be indicated in the order code.

Advantages

The regulator makes it possible to control the air flow within the pressure range from 50 to 1000 Pa, without any external power supply. The standard version of the regulator has the housing and the baffle made of galvanized steel, whereas the baffle axis is fastened in brass bearings. The special version of the regulator made of AISI304L stainless steel can be ordered. In accordance with EN1751, the housing leakage class is C. Due to intuitive adjusting mechanism, any flow rate maintained by the regulator can be set by the user independently.

Main Advantages

- Operating range 2 – 12 m/s
- Operating pressure 50 – 1000 Pa
- The possibility of changing settings by the user
- The possibility of making the version with an actuator
- Complies with EN 1751 air leakage has class C0
- It can be used both in ventilation air supply and air extraction ducts
- It can be mounted both vertically and horizontally
- It can be made with a seal on the service lines
- Round or rectangular options
- Scale accuracy $\pm 10\%$
- Operating temperature 10 – 80 °C

*sound level in dB/octave in relation to 10⁻¹²W

General:

- Minimum static pressure drop over the control P_{min} in Pa
- Sound power L_w in dB in the octave bands at a reference value of 10-12 Watt.
- The selection table shows the L_w and L_p values for discharge sound. The sound pressure levels L_p , dB(A) stated have taken into account the attenuation of a silencer and a ceiling diffuser with plenum box.
- The adopted room attenuation is 10dB. If the actual value is lower, the dB(A) values have to be corrected.
- Note: the L_w values have been measured with one end nozzle of the duct in the free room. (i.e. including end reflection). For rooms with a low sound level (<25dB(A)), hard surfaces, light walls etc. consult an acoustic consultant.
- The available pressure drop across the unit has to be minimal 50 Pa. Interpolation of intermediate values is acceptable.

Authority

To ensure accuracy of the unit, the pressure drop across the damper should be at least equal to the total pressure drop behind the unit (duct plus grilles, diffusers).

Commissioning

The advantage over conventional dampers is that repeated measurements and adjustments by a qualified commissioning engineer are no longer required.

If the system pressure changes, e.g. due to the opening or closing of duct sections, the volume flows in the entire system change; this is not the case when CAV constant flow regulators are used. The controllers respond immediately and adjust the damper positions directly so that the set volume flow is held constant over the entire differential pressure range. The CAV regulators can be supplied with an electric actuator for changing the set value.

Installation instructions

- CAV constant flow regulators are adjusted for the entire scaled application area.
 - To install the regulator, a straight inlet section which is at least three times as long as the nominal width and a straight outlet section which is at least 1.5 times as long as nominal width is required. Installation directly downstream or upstream of flow disruption points (bends, branches, etc.) reduces the control accuracy.
 - The volume flow set point is adjusted during installation. This does not affect the control accuracy.
 - The basic version is adjusted manually by setting the pointer to the required set point on the scale and fixing this setting.
 - Dual controller: If the duct cross section is larger than the available controller size, two or more CAV can be installed in parallel. The volume flow must be distributed in such a way that the same flow velocity is configured for each controller.
- Suitable metal plates for connecting the flanges and compensating for differences in length must be provided on site. Sound power levels must be added up.
- CAV constant flow regulators and sound attenuators are supplied individually. Assembly on site!

Accessories

Silencer

For reduction of internal flow noise. Sound attenuator length 500-750-1000-1500 mm.
For performance details check model K100 and R01 silencer catalogue.

Reheat Coil

- Separately deliverable for reheat of air volume
- Casing made of galvanised sheet steel
- Flanged on both ends
- Copper tubes and aluminium fins
- Generally two rows
- Maximum operating pressure 16 bar
- For warm water up to 100 °C
- Water connections horizontal, air venting by customer
